	1.1	Coding Guidelines	2

1 Contributing

Please read through this document before contributing to Doubtfire.

Before continuing, **please read the contributing document**¹ **of the API**, as this outlines the Git workflow you should be following.

1.1 Coding Guidelines

For extendability and maintenance purposes, following these guidelines:

- Name a directive with it's role in mind (i.e., as a **Agent Noun**²) to give a small summary as to what the directive *does*:
- when viewing a project or task, the directive is project-viewer and task-viewer
- when assessing task submissions, the directive is task-submission-assessor
- when editing a unit's tutorials, the directive is unit-tutorial-editor
- Name directives that show lots of data in one directive in a table a list: e.g.: unit-student-list, group-member-list, project-top-task-list
- Name directives with a series of steps to perform a goal a wizard, e.g.: project-portfolio-wizard, new-user-wizard
- Always name modals in Pascal Case SomeModal and create them as a factory/controller pair CoffeeScript file which can then be easily created on the fly:

```
# foo/modals/create-foo-modal.coffee
angular.module('doubfire.foo.modals.create-foo-modal', [])

#
# Prompts the user to create a Foo using a bar and qux variable
#
.factory('CreateFooModal', ($modal) ->
    CreateFooModal = {}

CreateFooModal.show = (bar, qux) ->
    $modal.open
    templateUrl: 'foo/modals/create-foo-modal.tpl.html'
    controller: 'CreateFooModalCtrl'
    resolve:
    bar: -> bar
    qux: -> qux

CreateFooModal
)
```

 $^{^1\}mathrm{See}$ https://github.com/doubtfire-lms/doubtfire-api/blob/develop/CONTRIBUTING.md

 $^{^2 \}mathrm{See}\ \mathtt{https://en.wikipedia.org/wiki/Agent_noun}$

```
.controller('CreateFooModalCtrl', ($scope, bar, qux) ->
  # Does stuff with bar and qux to create a foo
  $scope.bar = bar
  $scope.qux = qux
)

# foo/states/foo-view/foo-view.coffee
# ...
.controller('FooViewCtrl', ($scope, CreateFooModal) ->
  # ...
  $createNewFoo = ->
        CreateFooModal.show($scope.bar, $scope.qux)
)
```

- Always name non-anonymous controllers with a Ctrl suffix
- Case correctly:
- directiveName should be camelCase refer to this Angular documentation³
- ServiceName, ControllerNameCtrl should be in PascalCase
- Regardless of abbreviations, stick to these conventions (e.g., pdfPanelViewer directive works, but PDFPanelViewer won't work as it needs to be camelCase)
- Place modals and states in a modals and states folder under the root. All else can be in their own folders unless they are of a related concept (see the project-portfolio-wizard folder under project, stats under tasks and units)
- The name of a module should follow the directory structure of where it has been placed (i.e., in the above example, the template file was at foo/modals/create-foo-modal.tpl.html, the CoffeeScript file was at foo/modals/create-foo-modal.coffee, and thus the module is doubtfire.foo.modals.create-foo-modal
- Try to give a brief summary of what the directive, state or factory does. E.g., the comment in the example above for CreateFooModal is sufficient.
- Try to abstract as much code inside a model class as possible. At present a lot of this code is in a model's service, and it should be moved into the model's resource definition as much as possible:

Unit.addTutorial tutorialData

instead of:

unitService.addTutorial unit, tutorialData
